

You are developing an **Online Bookstore Management System** for a company using **ADO.NET with SQL Server**. The database contains tables: **Books, Customers, Orders, and OrderDetails**. The application should provide functionalities like customer registration, book management, order placement with stock verification, and sales reporting.

Tasks:

1. Create the database schema with the given tables: Books, Customers, Orders, OrderDetails.
2. Define primary keys, foreign keys, and relationships between tables.
3. Insert at least 5 sample books and 3 customers into the database.
4. Use SqlDataAdapter and DataSet to fetch all books and display them.
5. Update the stock of a book (e.g., new shipment arrived) using the disconnected architecture and commit the changes to the database.
